

Technical Safety Concept (TSC)

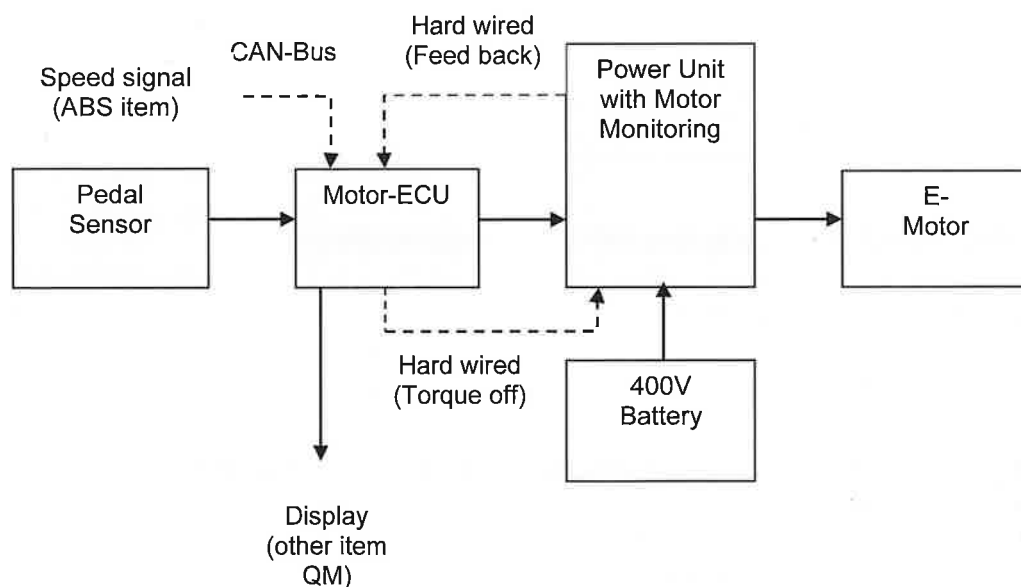

1 Introduction

The TSC is developed step by step, starting with a first realization concept, here called system draft. The system draft considers the preliminary Safety Architecture from the FSC, but now in a technical perspective.

In real projects the development of the TSC is an iterative process, which begins with the derivation of safety requirements, goes on with a design concept and ends with a verification of the design by analytical means.

2 System Draft

In this step the functional elements from the Preliminary Safety Architecture from the FSC are substituted by technical components (sensors, control units etc.). Of course also other requirements than only safety requirements are relevant for the design (e.g. vehicle architecture)
