

4.2 Component Design and Allocation of Component Safety Requirements

The derived Component Safety Requirements are allocated to the technical design of the component.

5 Hardware – Software Allocation

The system element safety requirements have to be allocated to hardware or hardware and software. This means to decide, whether the required measure will be designed in hardware alone or in a combination of hardware and software.

Note: In this training example all elements are allocated to a hardware solution.

In a next step the system safety requirements will be refined at hardware level (see “Hardware Safety Requirements Specification”)
